

Routing & Forms: Assignment 3

How I built the app:

I built the app by using the material provided in the course. I had already tested the example given by typing the code into vs code and separating the segments into individual modules.

I did not however import into the correct place the import { BrowserRouter as Router, Routes, Route, Link } from 'react-router-dom'; into the correct module. This meant that my application wouldn't run. I learnt that the module that uses the element must also be the one into which the import takes place and that elements are not inherently inherited .

I then built onto the application adding some styling in css modules and using classes. I perhaps could have re-used some of the classes, had I thought more about the file structure. However having each module styled separately meant that styling could be changed later, which I did in fact do, without interfering with the styles of other modules.

I had some issues trying to get the link to github work, so I used some large language model to help me and to explain how it works. The styling also was my own idea, as I have film photography as a hobby, I wanted light tones and images to reflect me, I did get some help from Ai to help with the rendering and scaling the styles of my images correctly.
